

MicroSolved Announces The Solution To Insider, Bot-Net and Zero-Day Threats

The HoneyPoint Security Server is MSI's™ new Internal Threat Monitor for Enterprise Networks. By turning the idea of a traditional honeypot on its side, MSI has created an invaluable supplement for internal IDS/IPS systems.

for Immediate Release

COLUMBUS, Ohio/EWORLDWIRE/July 28, 2006 --- MicroSolved, Inc., a proven leader in information security consulting, announces the release of its new product, HoneyPoint Security Server ("HoneyPoint"). HoneyPoint is designed to serve as a supplement to existing intrusion detection and prevention technologies for organizations seeking to secure their internal networks against the ever-evolving threats of cyber-attack.

"HoneyPoint's™ advantages are clearly a revolution in how we think about intrusion detection on our production networks," said Brent Huston, CEO of MicroSolved. "The primary problems of continual tuning, signature management and the impossibly high level of false positives simply don't™ exist in the HoneyPoint solution. They are 'deploy and forget' technologies that simply work."

HoneyPoint Security Server is a new enterprise version of a low interaction honeypot. While more traditional honeypot technologies failed to be adopted on a wide-scale by most organizations due to their complexity, MicroSolved has created HoneyPoint to make the advantages of honeypots easy to use for organizations of any size. The features include centralized reporting, alerting via email, syslog and Windows event logs, as well as the ability to emulate many platforms and thousands of network services.

"The most exciting part of HoneyPoint is the flexibility it brings - it runs on Windows, Linux/UNIX systems and even Mac OS X. The HoneyPoints can be deployed to emulate just about any service, making it nearly impossible for an attacker to do anything in a network environment without being discovered and tracked," said Troy Vennon, senior security engineer at MicroSolved.
